ö
genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposoase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid and transposition reaction in the presence of a target nucleic acid acid acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end acquence recognized by a transposase, and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a Cat-Mu transposon modified end

The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a transposson end acid having the transposon incorporated in the protein coding nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu(Stop)-transposon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

by a

translation stop signal within a transposon end sequence recognized b transposase useful for producing deletion derivatives of polypeptide.

Claim 6; Page 30; Opp; English.

New transposon nucleic acid comprising a genetically engineered

WPI; 2003-845329/78.

The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence in containing a transposon and sequence in the presence of a transposon in a confort of the presence in the prospection coding nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu (Stop)-transposon

                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                      The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon end sequence recognized by a of polypeptide coding nucleic acids. The method involves performing a cransposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a target nucleic acid as sequence in three reading frames at least partly within a transposon end sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase; and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a Cat-Mu transposon modified end
                                                                                                                                                                                                                                                                                     by a
                                                                                                                                                                                                                                                                         New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized transposase useful for producing deletion derivatives of polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Precut transposon end of Bacteriophage Mu non-transferred strand, ::-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for making an insertional mutation at a random or quasi-random position in cellular nucleic acid in a target cell comprising introducing into the target cell a synaptic complex. The method is particularly useful for efficiently inserting a transposable polynucleotide at random or quasi-random locations in the chromosomal or extra-chromosomal nucleic acid of a target cell. The method may also be used for screening the genome of cells that comprise an insertional mutation that induces a phenotypic or genotypic change relative to the cells that are not subject to insertional mutagenesis. The present sequence is the precut transposon end of Bacteriophage Mu non-transferred strand, used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /*tag= a

                                                                                                                                                                                                                                                                             genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end acquence recognized by a transposase; and recovering a transposon end acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a Cat-Mu transposon containing wild
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preparing a targeting construct using a transposon and DNA recombination sequence, useful in making a targeting vector capable of modifying plant and/or animal genome in a predetermined way.

ó
sequence comprising a transposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and finducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence comprising a transposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence or tarnsposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target compositions of the present invention are useful for preparing a target recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preparing a targeting construct using a transposon and DNA recombination sequence, useful in making a targeting vector capable of modifying plant and/or animal genome in a predetermined way.

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence and a bitro, inserting a DNA sequence comprising a transposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention

The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a transposon containing a genetically engineered translation stop signal sequence recognized by a transposase, and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid, The present sequence represents a modified Cat-Mu transposon containing Mu ends with engineered NotI restriction site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting a mismatch in a test double stranded nucleic acid target, useful for typing a pathogenic microorganism strain, comprises detecting transposition of the Mu-end nucleic acid into the target.
                                                                                    New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by transposase useful for producing deletion derivatives of polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of detecting a mismatch in a test double stranded nucleic acid target which comprises detecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to methods of preparing a targeting construct for use in a targeting vector capable of modifying a target DNA sequence, by obtaining a copy of the target DNA sequence in vitro, inserting a DNA sequence comprising a transposon sequence and a DNA recombination sequence at two sites in the copy of the target DNA sequence, and inducing a recombination event between the recombination sequences to delete a portion of the copy of the target DNA sequence. The methods and compositions of the present invention are useful for preparing a target construct for use in a targeting vector for gene targeting or homologous recombination. They can also be used for precisely modifying plant and/or animal genome in a predetermined way. This sequence represents a primer used in an example of the invention
                                                                                                                                                                                                                                                                Preparing a targeting construct using a transposon and DNA recombination sequence, useful in making a targeting vector capable of modifying plant and/or animal genome in a predetermined way.

```
transposition of the Mu-end nucleic acid into the target, where transposition at the predominant site indicates the presence of mismatch at about that site. The methods are useful for typing a pathogenic microorganism strain, for screening an embryo for the presence of mutation, for detecting the presence of known mutation in a gene of interest, detecting the presence of a previously unidentified mutation in a gene of interest, and diagnosing the presence or absence of a tumour-promoting mutation. The kit is useful for detecting the presence of a mutation or polymorphism of interest in a nucleic acid molecule. The present sequence represents the Mu end DNA fragment construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of detecting a mismatch in a test double stranded nucleic acid target which comprises detecting transposition of the Mu-end nucleic acid into the target, where transposition at the predominant site indicates the presence of mismatch at about that site. The methods are useful for typing a pathogenic microorganism strain, for screening an embryo for the presence of mismation, for detecting the presence of known mutation in a gene of interest, detecting the presence of known mutation in a gene of interest, and diagnosing the presence or absence of a tumourageneously mutation. The kit is useful for detecting the presence of a number of any promoting mutation. The kit is useful for detecting the presence of a nutation or polymorphism of interest in a nucleic acid molecule. The present sequence represents the Mu end DNA fragment construction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting a mismatch in a test double stranded nucleic acid target, useful for typing a pathogenic microorganism strain, comprises detecting transposition of the Mu-end nucleic acid into the target.

The Mu-like element comprises: (a) a left transposable element attachment site attl and a right transposable element attachment attR is no more than 62 nucleotides long; (b) a site for insertion of an exogenous DNA sequence encoding for a protein domain located between attL and attR; (c) after insertion of the transposable element into a target DNA sequence, a fusion mRNA sequence is transcribed originating either from the target DNA on either side of the transposable element or from inside the transposable element and continuing through the attachment site sequences and into the protein coding region, resulting in a single development of a protein domain library, in the construction of multi-

Note="Wetcor: pBluescript SK(-); Site 1: EcoRI; Site 2:
XhOI; Morex (mla) plants were greenhouse grown in the R
Wise lab at lowa State University, Ames, IA; 7 day old
green seedlings were infected with isolate 5874 of
Blumeria graminis f. sp. hordei, and leaves were harvested
24, 48 and 72 hr post-incoulation and snap frozen (Wise).
In the TJ Close lab at the University of California,
Riverside, total RNA was prepared from each sample pool,
equal quantities of all three RNA pools were combined,
poly(A) RNA was purified from the mixture, one primary
unamplified cDNA library was made, and 1 million pfu were
in vivo excised to give pBluescript SK(-) cDNA phagemids
(Chin). Phagemids were plated and picked at the Clemson
University Genomics Institute (CUGI) (Begum, Palmer,
Frisch, Atkins and Wing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main).
The sequence has been trimmed to remove vector sequence
and contains a minimum of 100 bases of phred value 20 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      7;

/note="Weetor: pBlusecript SK(-); Site_1: ECORI; Site_2: XhoI; Morex (mla) plants were greenhouse grown in the R Wise lab at lowa State University, Ames, IA; 7 day old green seedlings were infected with isolate 5874 of Blumeria graminis f. sp. hordei, and leaves were harvested St. 48 and 72 hr post-inoculation and snap frozen (Wise). In the TV Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and I million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and ploked at the Clemson

green seedlings were infected with isolate 5874 of Blumeria graminis f. sp. hordei, and leaves were harvested 24, 48 and 72 hr post-incoulation and snap frozzen (Wise). In the TJ Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purlied from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids (Chin). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Aktins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Aktins and Ming). Plasmid DNA preparations, DNA sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see thip://www.genome.clemson.edu/projects/barley. To order this clone see http://www.genome.clemson.edu/projects/barley. HyCDNA0014 (Blumeria infected)"
/note="Vector: pBluescript SK(-); Site_1: ECORI; Site_2:
XhOI; Morex (mla) plants were greenhouse grown in the R
Wise lab at Iowa State University, Ames, IA; 7 day old
green seedlings were infected with isolate 5874 of
Blumeria grammins f. sp. hordei, and leaves were harvested
24, 48 and 72 hr post-inoculation and snap frozen (Wise).
In the TJ Close lab at the University of California,
Riverside, total RNA was prepared from each sample pool,
equal quantities of all three RNA pools were combined,
poly(A) RNA was purfited from the mixture, one primary
unamplified cDNA library was made, and 1 million pfu were
in vivo excised to give pBluescript SK(-) cDNA phagamids
(Chin). Phagemids were plated and picked at the Clemson
University Genomics Institute (CUGI) (Begum, Palmer,
Frisch, Aktins and Wing). Plasmid DNA preparations, DNA
sequencing and sequence analysis were performed at CUGI
(Wing, Yu, Frisch, Henry, Simmons, Oates, Rambb, Main).
The sequence has been trimmed to remove vector sequence
and contains a minimum of 100 bases of phred value 20 or
above. For more details on library preparation and
sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Verjovski-Almeida,S., DeMarco,R., Martins,E.A.L., Guimaraes,P.E.M., Ojopi,E.P.B., Paquola,A.C.M., Piazza,J.P., Nishiyama,M.Y.
